

FRIDAY 2.0 — LEVEL DESIGN

Technical Specification

EDITH VAULT — THREE-FACTOR ACCESS

Factor 1: Hardware UUID (system-specific identifier, verified on startup)

File: ~/.hermes/.edith/hardware_uuid | Must match local system

Factor 2: Passphrase + Salt (knowledge-based authentication)

File: ~/.hermes/.edith/passphrase_hash | bcrypt-10, constant-time comparison

Factor 3: Time-Window Gating (behavioral access control)

Window: ±5 minutes from last successful authentication | Auto-purge: credentials expire after 5 min idle

CREDENTIAL STORAGE & ENCRYPTION

Service	File	Format	Encryption
Google OAuth	google_oauth_vault	JSON (600 perms)	AES-256-GCM
GitHub PAT	github_pat_vault	JSON (600 perms)	AES-256-GCM
EDITH Questions	verification_hashes	SHA-256 + salt	No plaintext

VERIFICATION PROTOCOL (3-Question Challenge)

Q1: Favorite football team? → **Real Madrid**

Q2: Favorite character? → **Pepper Potts**

Q3: Favorite person? → **Myself**

Rule: All 3 must pass in order; failure locks EDITH for 30 minutes

PERSONAL FRAMEWORK — 5 CORE RULES

Rule	Trigger	Action	Threshold
30-Day Rule	Recurring task identified	Auto-design automation	If effort ≤30 days
Minimal Context	Rough notes received	Infer intent & execute	If confidence ≥0.75
Intent Inference	Pattern observed in history	Deliver on best match	Explicit Q if <0.75
Silence Protocol	Idle time >60 min	Continue logical next steps	Must have queued work
Execution-First	New task requested	Ship MVP immediately	Iterate from live work

IMPLEMENTATION CHECKLIST

- EDITH three-factor gate hardening + verification protocol

- Personal framework rules codified in operating system
- Skill library consolidation (retire 77 unused)
- All credentials moved to EDITH (encrypted, centralized)
- Tanzim_Frameworks repo published with decision rules
- End-to-end smoke test (all integrations, all principles)
